Dehradun, India

EDUCATION

B.Tech, Civil Engineering
Graphic Era University, Dehradun
12th - Gautam International
Senior Secondary School
10th - Army Public School, Dehradun

SKILLS

- AWS, Azure
- Linux, Bash & Shell Scripting, PowerShell, Python
- Git, GitHub
- Jenkins, GitHub Actions, Travis CI
- Terraform, Ansible
- Docker, Kubernetes (K8s), AWS ECS
- Prometheus, Grafana, ELK Stack, CloudWatch
- Apache Kafka
- SonarQube, Cypcode
- Sonatype Nexus
- Jira, Confluence, Draw.io
- PostgreSQL, RDS, JBoss, Tomcat

LAKESH SHARMA

SENIOR DEVOPS ENGINEER

PROFILE

Senior DevOps Engineer with 7+ years of experience designing, automating, and securing cloud infrastructure across AWS and Azure. Skilled in CI/CD pipeline design, Infrastructure as Code (IaC), containerization (Docker/Kubernetes), and security/vulnerability remediation automation. Proven track record building internal tooling that improves release velocity, compliance reporting, and operational visibility.

WORK EXPERIENCE

Aristocrat Technologies (aristocrat.com) SEP 2023 - PRESENT
Senior DevOps Engineer 2

- Built an internal admin automation tool (PowerShell/WPF) to streamline operational and administrative workflows.
- Automated security vulnerability reporting and remediation tracking using SonarQube and Cypcode, generating recurring compliance reports for stakeholders.
- Maintained and hardened Debian- and RHEL-based firmware image build pipelines, resolving vulnerability-scan findings at the build/image level.
- Led tooling and scripting for a version-control migration from TFS (TFVC) to GitHub, including standardizing branching strategy across teams.

To The New (tothenew.com) JUN 2023 - AUG 2023
Senior DevOps Engineer

- Owned end-to-end AWS infrastructure for staging and production environments (tothenew-staging and production sites).
- Managed core AWS resources: Route 53, CloudFront (CDN), Load Balancers, VPC (full network design), Auto Scaling, EC2, and Elastic Container Service (ECS).
- Provisioned and maintained infrastructure using Terraform.

Bristlecone (bristlecone.com) JAN 2022 - APR 2023
DevOps / Associate Engineer

Project: WebxD | Team Size: 5-6 Members

- Implemented CI/CD pipelines using Jenkins and Jenkinsfile for streamlined deployments.
- Provisioned and configured servers for code deployment using Terraform and Ansible.
- Released/deployed code to Staging and Production servers via CI/CD pipeline.
- Troubleshot errors and handled upgrades.

Project: Data Science POC - Estimating Future Customer Base Growth in EV Manufacturing | Team Size: 2 Members

- Developed a serverless architecture using AWS services (EC2, Lambda, S3, Redshift).
- Created and managed ETL jobs using AWS Glue and SageMaker; utilized QuickSight, EFS, KMS, SNS, CloudWatch, and RDS.
- Employed Python for scripting and automation.

Project: Payment Gateway | Team Size: 5-6 Members

- Automated environment build and provisioning using containerization and orchestration tools — Docker and Kubernetes.
- Utilized Git, Shell scripting (Linux), Jenkins, and Maven for build automation and CI/CD workflows.
- Set up Jenkins- and Docker-based build pipelines on AWS.
- Introduced pipeline automation best practices to improve build and release consistency.
- Worked with AWS services: EC2, S3, VPC, Load Balancing, Auto Scaling, EBS.

Project: Centralized Healthcare Platform (Historical Medical Data Management)

- Managed source code via GitHub, following standard branching and version-control practices.
- Provisioned AWS infrastructure using Terraform for consistent, repeatable environment setup.
- Deployed applications via Jenkins CI/CD pipelines, including Docker-based build and deployment steps.
- Authored Docker and Kubernetes manifests for containerized deployment.
- Collected and analyzed server logs for troubleshooting and operational visibility.
- Monitored Kubernetes and Linux server health using monitoring tools.

ROLES & RESPONSIBILITIES

- Cloud Infrastructure Development: Build and manage infrastructure on AWS and Azure, ensuring adherence to security best practices and performance requirements.
- Cost Optimization: Implement strategies to lower infrastructure costs on AWS and Azure, using cost estimation, anomaly detection, and trigger-based spend alerts.
- Troubleshooting: Address daily infrastructure errors and optimize server performance across cloud and on-premises environments.
- Debugging and RCA: Debug build failures in collaboration with developers and QA, conducting root cause analysis for database/API performance issues, security vulnerabilities, and compliance requirements (incl. RFC 5432).
- CI/CD Pipeline Management: Design and maintain CI/CD pipelines using Jenkins, Travis CI, and GitHub Actions, provisioning infrastructure with Terraform and Ansible.
- Containerization: Implement Docker and Kubernetes for application containerization; configure application servers (JBoss, Tomcat) and databases (PostgreSQL, RDS).
- Security and Monitoring: Perform security hardening, TLS/SSL configuration, and implement monitoring/alerting for infrastructure and applications.
- Task Automation and Documentation: Automate tasks using shell scripts and cron jobs; author runbooks and documentation for processes, architectures, and configurations.
- Version Control Migration: Led migration efforts from TFS to GitHub and SVN to GitHub, standardizing source control practices and branching strategy across teams.
- Cloud Migration and System Upgrades: Facilitate migrations from on-premises servers to cloud platforms and manage system upgrades.
- Real-Time Data Streaming: Set up and monitor Apache Kafka for real-time data streaming, optimizing performance and implementing backup/recovery strategies.
- Build Configuration and Release Management: Configure Jenkins master-slave setups, manage plugins, and oversee branching, merging, and release activities across teams.
- Collaboration and Process Improvement: Work closely with development, QA, and client teams to ensure successful project delivery, while recommending improvements to existing DevOps processes.
- DevOps Research and Trends: Stay current on emerging DevOps tools and practices, documenting findings for continuous improvement.
- Incident Management: Participate in on-call rotations and incident response, diagnosing and remediating issues to minimize downtime.
- Infrastructure as Code Governance: Build reusable, modular Terraform and Ansible templates to standardize provisioning across projects and teams.
- Access and Identity Management: Manage IAM roles, policies, and access controls to enforce least-privilege security across cloud environments.
- Backup and Disaster Recovery: Design and test backup and disaster recovery procedures to safeguard business continuity.
- Tool Evaluation and Onboarding: Evaluate and onboard new DevOps tools and platforms to improve team productivity and system reliability.
